Definition Pathophysiology And Pathogenesis Of

Pathophysiology and pathogenesis are two medical disciplines that describe the characteristics of diseases. When describing a disease, etiology or the origin of the disease has to come first. Secondly, pathogenesis describes the development of the disease. Finally, pathophysiology describes the physiological process of the disease.

What is the Difference Between Pathophysiology and ...

Pathophysiology and pathogenesis are two similar terms used to explain the occurrence of a disease and related mechanisms and characteristics. Pathophysiology concerns the conditions observed during a disease state and the processes going on within an organism. Pathogenesis mainly focuses on the origin and development of a disease.

This section presents a definition of asthma, a description of the processes on which that definition is based—the pathophysiology and pathogenesis of asthma, and the natural history of asthma. Asthma is a common chronic disorder of the airways that involves a complex interaction of airflow obstruction, bronchial hyperresponsiveness and an underlying inflammation.

Asthma triggers are viral illnesses, such as those that cause the common cold and identifiable allergies. This airway narrowing causes symptoms such as wheezing, shortness of breath, chest tightness, and coughing. While measurement of airway function is possible for adults, most new cases are diagnosed in children who are unable to perform such tests. Diagnosis in children is based on a careful compilation and analysis of the patient's medical history and subsequent improvement with an inhaled bronchodilator medication.
