This book is intended as a tribute to Gianluca Spina, the influential and inspiring Professor of Business Management & Organization and Supply Chain Management at the School of Management of Politecnico di Milano, who very sadly passed away early in 2015. It brings together seven of his most important papers, published in renowned international journals, and supplements these papers with insightful commentaries from friends and colleagues who highlight key messages and values of enduring validity. The selected

papers offer a clear sense of Spina ' s research journey over the years and cover the main research streams that distinguished his work. They have also been chosen on account of their high impact, as reflected by the number of citations received, and to represent the most important research collaborations that Spina had established within Italy and abroad. An introductory chapter relates his research to major developments in the field of Manufacturing and Supply Chain Strategy and also outlines the very important contribution that Gianluca Spina made to Management Education.

This book summarizes the latest research on advanced intelligent systems in the fields of energy and electrical engineering, presented at the second edition of the International Conference on Advanced Intelligent Systems for Sustainable Development (AI2SD ' 2019), held in Marrakech from 8 to 11 July 2019, Morocco. This book is intended for researchers, professionals and anyone interested in the development of advanced intelligent systems in the electrical engineering sector. The solutions featured focus on three main areas: motion control in complex electromechanical systems, including sensorless control; fault diagnosis and fault-tolerant control of electric drives; and new control algorithms for power electronics converters. In addition, the book includes a range of research using new technologies and advanced approaches. Offering a platform for researchers in the field of energy to share their work related to the problem of management and optimization of energy, which is a major current concern, the book mainly focuses on areas that go hand in hand with the Industrial Revolution 4.0, such as solar energy computing systems, smart grids, hydroelectric power computing systems, thermal and recycling computing systems, eco-

design intelligent computing systems, renewable energy for IT equipment, modeling green technology, and renewable energy systems in smart cities. The authors of each chapter report the state of the art in the topics addressed and the results of their own research, laboratory experiments, and successful applications in order to share the concept of advanced intelligent systems and appropriate tools and techniques for modeling, storage management, as well as decision support in the field of electrical engineering. Further, the book discusses a number of future trends and the potential for linking control theory, power electronics, artificial neural networks, embedded controllers and signal processing.

The rather young field of research into electricity savings is attracting increasing attention since low electricity consumption is a vital component of environmentally sustainable development. The potential benefits from using less electricity, without sacrificing quality of life, are immense, as the book shows with case studies from Eastern and Western Europe and the USA. Saving electricity means that the expense of constructing scores of power plants can be saved, and that their economic and environmental impact will vanish. Audience: Can be read with profit by any graduate. Suitable as a reference work for Master's and Doctoral students, as well as for others working on environmental issues in general and electricity savings in particular.

Design for the Unexpected: From Holonic Manufacturing Systems Towards a Humane Mechatronics Society presents new, even revolutionary, ideas to managing production and production systems which may fundamentally shift the paradigm of manufacturing systems design. It provides

guidelines for the design of complex systems that can deal with unexpected disturbances and presents a decentralized control methodology that goes far beyond the traditional hierarchical control approach that currently prevails. The benefits are illustrated by a variety of examples and case studies from different fields, with the book's well-established authors presenting Holonic Manufacturing Systems (HMS) as the framework for the 'factory-of-the-future', and suggesting that the application of biologically inspired control paradigms can control complex manufacturing systems, and that there are far wider applications for these systems than pure manufacturing. In addition, the book explores how this multi-agent control framework can be extended to other fields such as traffic, transport, services, and health care. Provides a practical control system architecture that can be applied to a wide variety of systems in manufacturing, transportation, logistics, and robotics Contains a wide range of case studies from different engineering disciplines Provides a decentralized control methodology that goes beyond the traditional hierarchical control approach that currently prevails A must-read resource for researchers and professionals alike
