Distributed computing is a field of computer science that studies distributed systems. A distributed system is a system whose components are located on different networked computers, which communicate and coordinate their actions by passing messages to one another. The components interact with one another in order to achieve a common goal. Three significant characteristics of distributed systems are: concurrency of components, lack of a global clock, and independent failure of components. Examp

Based on this, many fundamental algorithms are introduced. Although the algorithms are given in pseudocode, it makes me understand the wisdom behind these algorithms more directly. After the model and algorithms, various interesting topics in the area of distributed system are introduced.

Chapter 14: Consensus and Agreement

- Distributed computing is a model used for distributed systems. A distributed system is a collection of separate and individual computing devices that can communicate with each other. It is a computing model wherein system components are distributed across multiple computers but they run as one system to solve a problem.
