To graph a first-degree equation: Construct a set of rectangular axes showing the scale and the variable repre- sented by each axis. Find two ordered pairs that are solutions of the equation to be graphed by assigning any convenient value to one... Graph these ordered pairs. Draw a straight line ...

A solid dot on a number line graph indicates that the given number should be included as a possible solution, whereas an open dot indicates that the given number cannot be a solution. For example, if you graph x > 7, you place an open dot at 7 because it's not a valid answer (7 is not greater than itself).

Algebra: Graphing Solutions - InfoPlease
Graph the following system of equations and identify the solution. 2x - y = 8. 6x - 3y = 24. There are two ways to graph a standard form equation: Rewrite the equation in slope intercept form. Find the x and y intercepts. When you are graphing a system of equations that are written in standard form, you can use either method.

Step 1: Find the y-intercept and plot the point. Step 2: From the y-intercept, use the slope to find the second point and plot it. Step 3: Draw a line to connect the two points.

Solving Systems by Graphing. When you are solving systems of equations (linear or otherwise), you are, in terms of the equations' related graphed lines, finding any intersection points of those lines. For two-variable linear systems of equations, there are then three possible types of solutions to the systems, which correspond to three different types of graphs of two straight lines.

Systems of Linear Equations: Graphing
Step 1 We must solve for one unknown in one equation. We can choose either x or y in either the first or second equation. Step 2 Substitute the value of x into the other equation. In this case the equation is 2x + 3y = 1. Substituting (4 +... Step 3 Solve for the unknown. Remember, first remove ...

The graph of y ≤ x + 7 is shown here. When both inequalities are graphed on the same coordinate axes, you can see what points they share. For example, in the next figure, you see that the points are all common solutions of the two inequalities. They are all solutions of the system.

Now an inequality uses a greater than, less than symbol, and all that we have to do to graph an inequality is find the the number, '3' in this case and color in everything above or below it. Just remember. if the symbol is (≥ or ≤) then you fill in the dot, like the top two examples in the graph below

Graphing Inequality on Number Line. Step by Step Examples ...
The solutions are given by the two points where the graph intersects the x-axis. Example: Solve the equation x 2 + x – 3 = 0 by drawing its graph for –3 ≤ x ≤ 2. Solution: Rewrite the quadratic equation x 2 + x – 3 = 0 as the quadratic function y = x 2 + x – 3. Draw the graph for y = x 2 + x – 3 for –3 ≤ x ≤ 2.

To graph a linear inequality in two variables (say, x and y), first get y alone on one side. Then consider the related equation obtained by changing the inequality sign to an equality sign. The graph of this equation is a line. If the inequality is strict (< or >), graph a dashed line.

Solutions to differential equations can be graphed in several different ways, each giving different insight into the structure of the solutions. We begin by asking what object is to be graphed. Do we first solve the differential equation and then graph the solution, or do we let the computer find the solution numerically and then graph the result?

The set of solutions that we've graphed below is often called the family of solution curves or the set of integral curves. The number of solutions that is plotted when plotting the integral curves varies. You should graph enough solution curves to illustrate how solutions in all portions of the direction field are behaving.
